

Create IPO Chart and code for each problem below.

1.The input consists of quantity, price and discount rate. Use a function to compute the discount amount and discounted price.Then display these values in main along with the quantity and price. (The function should return both discount amount and discounted price).

Input	Process	Output
Quant	Pass price and discount rate to function	Quant
Price	Discount Amount = Price * Discount rate	Price
Discount Rate/%	Discounted Price = Price - Discount Amount	Discount Amount
	Return both discount amount and discounted price	Final discounted price

2. Enter the student's last name and 3 exam scores. Use a function to compute the average and total points. This functions should return both total points and exam score. Display student last name, total points and average exam score.

Input	Process	Output
Iname	Pass all exam scores to function	Iname
Exam score 1/2/3	Total points = score1+2+3	Total points
	Avg score = Total points / 3	Avg exam score
	Return both total points and exam score	

3. Produce a sales report. Input salesperson last name and sales. Write a function that compute commission which is 10% for sales over \$100, 000 and 5% for sales at or under \$100,000. The function should also computer next year's target which is 5% of the sales. This function should return both commission and next year's target. Display salesperson name, commission and next year's target.

Input	Process	Output
Salesperson Iname	Pass sales to function?	Salesperson Iname
Sales amount	Commission Rate = Sales > 100,000 = 10% Else:5%	Commission
	Commission = Sales * Rate	Next years target
	Next Year Target: Sales * 5%	
	Return both commission and next years target	

4. Enter bowler last name, 3 game scores and handicap. Write a function to compute average score and average score with handicap. Back in main, display last name, average score and average score with handicap.

Input	Process	Output
Bowler Iname	Pass all game scores and handicap to function	Bowler Iname
Game score of all games (1-3)	Avg score = Sum of all game scores /3	Avg score
Handicap pts	Avg with Handicap = Avg Score + Handicap	Avg score with handicap
	Return both avgs?	

5. Allow the user to enter quantity of an item and unit price. Write a function to compute total (qty * unit price) and tax (7% of total). Demonstrate your knowledge of global variables by making total and tax global in scope. Display total and tax in main.

Inout	Process	Output
Quant	Total = Quant * Unit Price + 7% tax	Total
Unit Price	Store total and tax as global variances	Tax
	Return values from function?
